

PROJECT
#THE WATCHER

Crafted By
ATHUL K M

Game Overview:

The Watcher is an immersive XR puzzle-adventure where players guide a tiny warrior through a massive ancient world. By using hand interactions, players manipulate the environment in real time to solve puzzles, clear pathways, and protect the warrior from dangers while exploring a mysterious, crumbling realm.

Core Concept:

The player takes the role of The Watcher, a powerful unseen presence that helps a small warrior survive. Through hand gestures and environmental control, the player moves objects, activates mechanisms, and reshapes the surroundings while the warrior reacts and progresses through the world.

Gameplay Mechanics:

- Hand-Based Interaction: Grab, rotate, and move environmental objects using XR controls.
- Environmental Puzzles: Rearrange ruins, platforms, and artifacts to create safe paths.
- Guided Companion: The warrior responds to the Watcher's actions and navigates obstacles.
- Trap Avoidance: Prevent the warrior from falling into traps or encountering dangerous hazards.

World & Setting:

The story unfolds in a vast ancient realm filled with gigantic ruins, mysterious structures, and forgotten relics. The scale of the environment emphasizes how small and vulnerable the warrior is within the world.

A Shopping Trip to Eklan Tor

Player Goal:

- Solve environmental puzzles.
- Protect and guide the warrior safely.
- Discover story fragments hidden in the ruins.
- Help the warrior escape the collapsing world.

Target Experience:

- Immersive XR interaction
- Puzzle-driven exploration
- Companion-based storytelling
- Sense of scale, mystery, and discovery

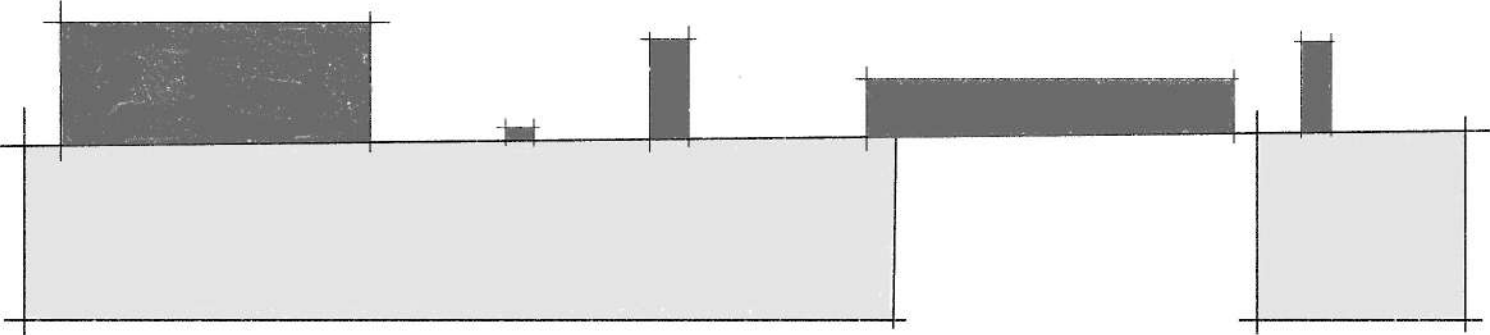

Game Reference:

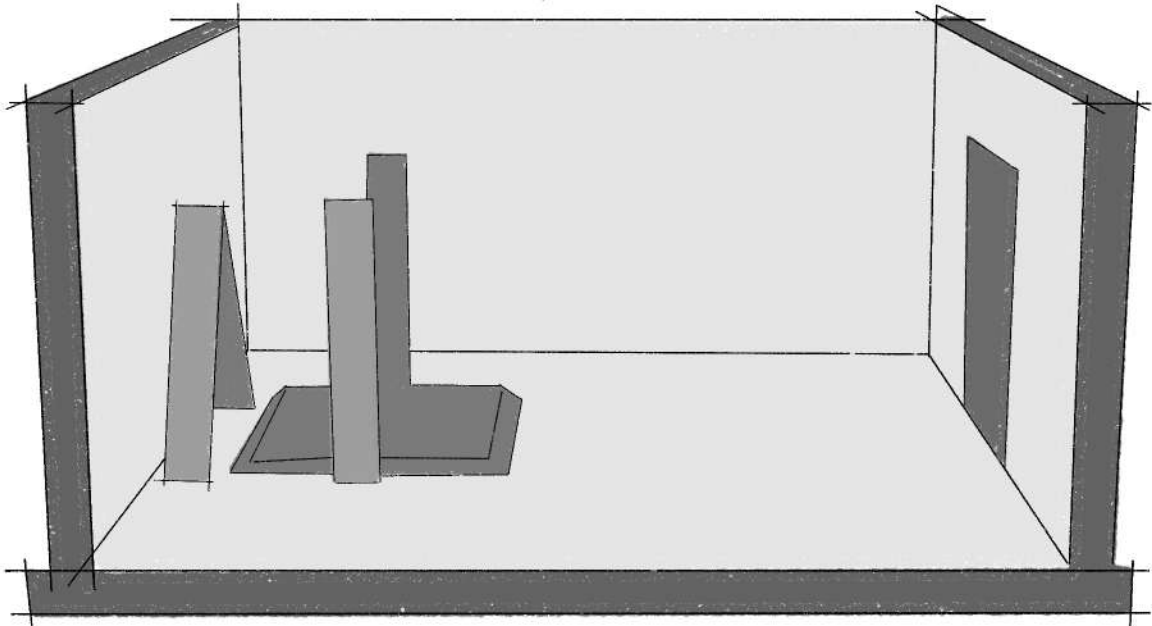

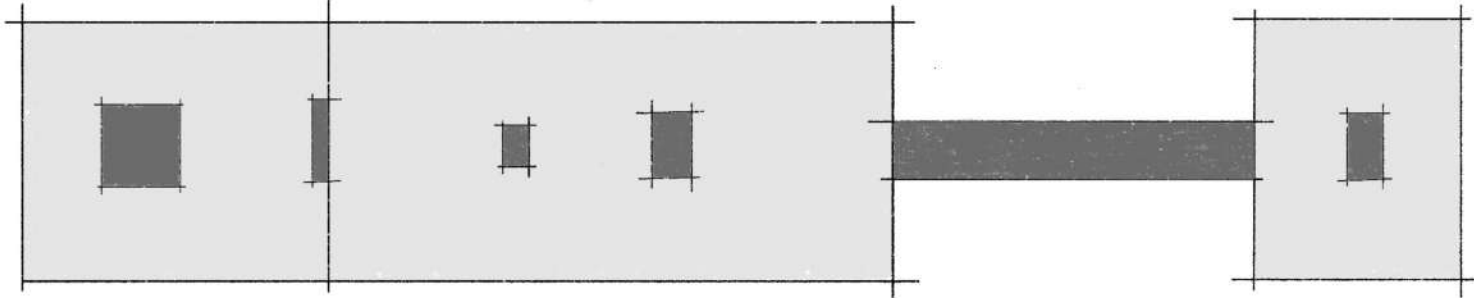

A Shopping Trip to Eklan Tor, is a whimsical adventure where players explore the lively marketplace of Eklan Tor, completing errands, interacting with quirky characters, and discovering unexpected surprises along

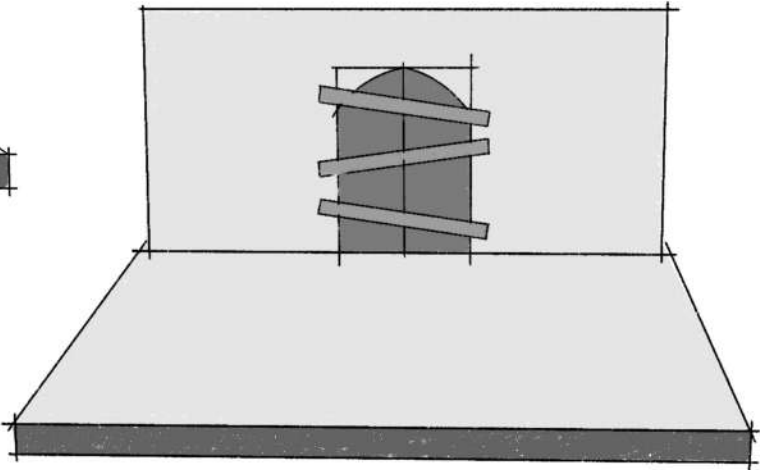

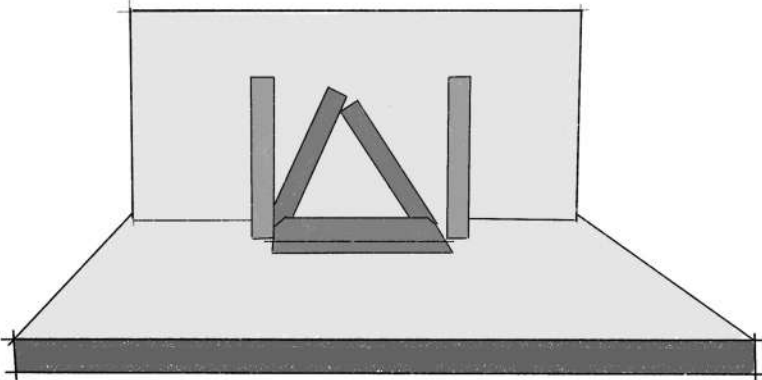

Game world Rough Sketching:

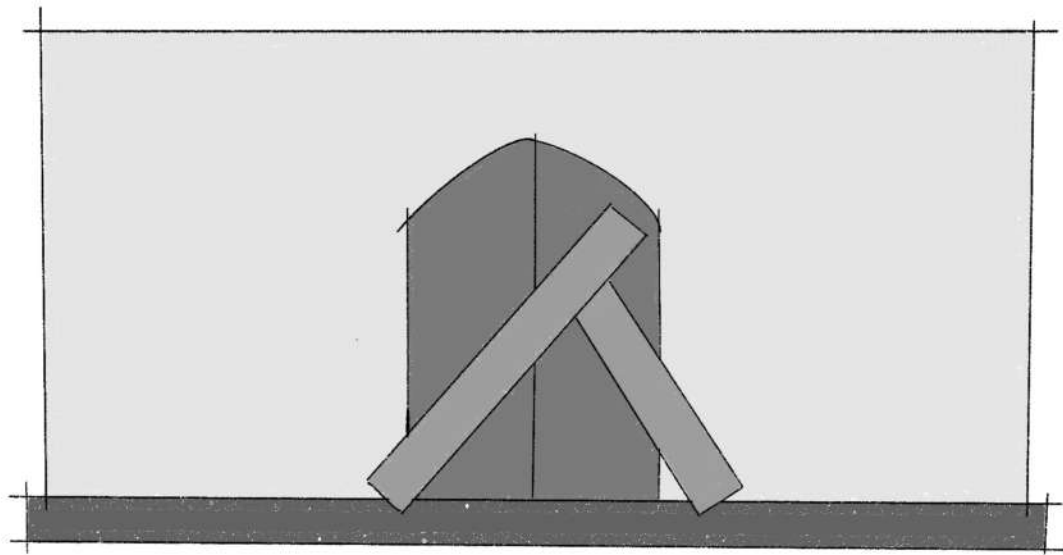

Top and side view of the main level

The main room where the player is imprisoned , tide his hand to the main pillar where the player has to break the chains to fre him

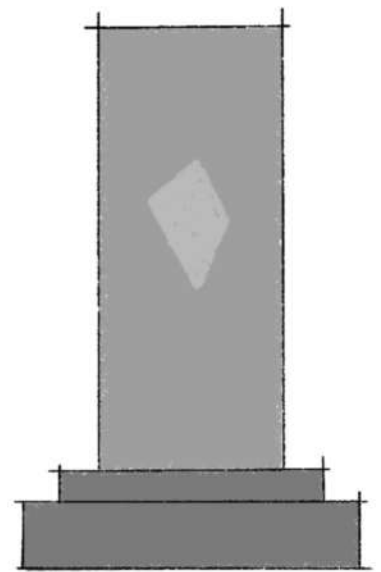

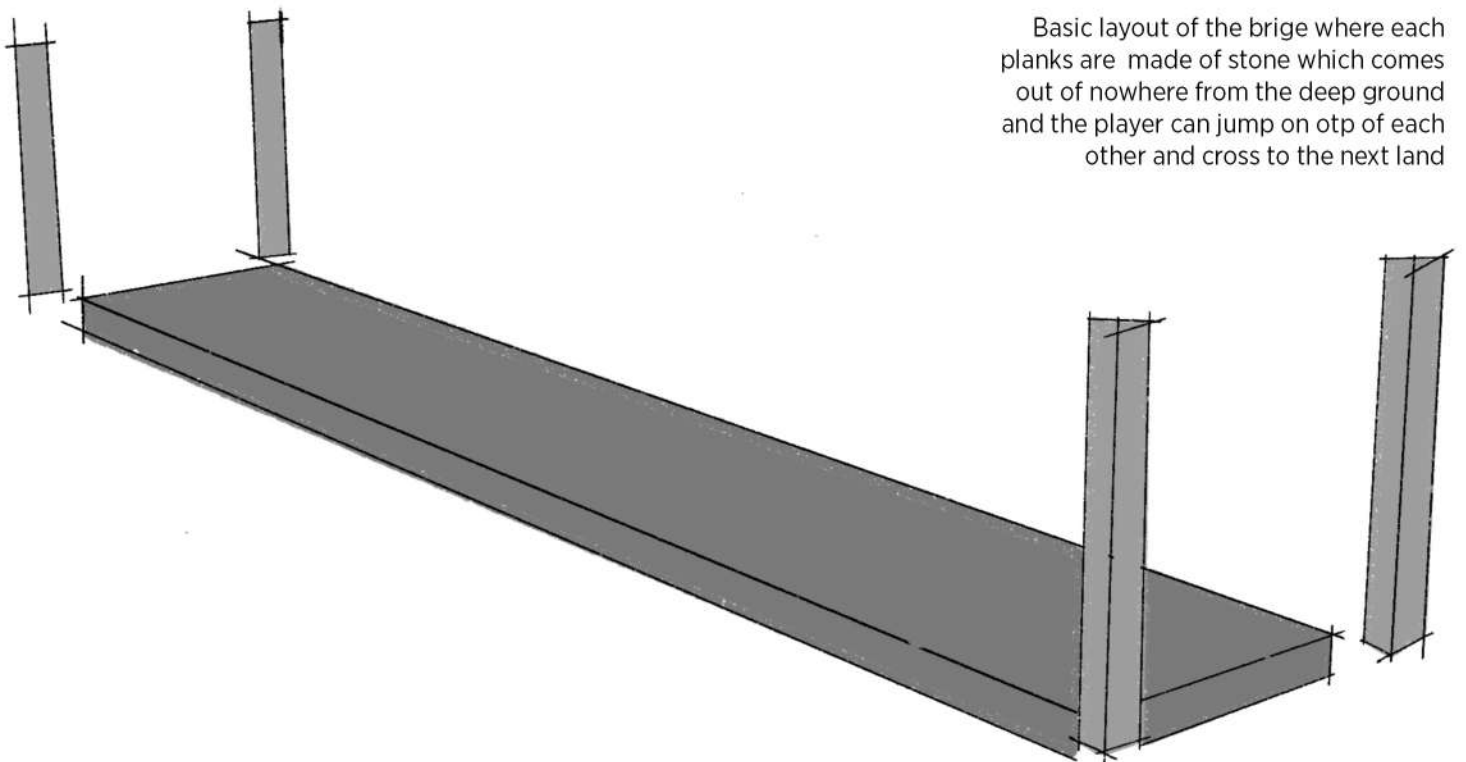

After rescuing the warrior
we help him move the
heavy pillars placed on
the main door

These are the pressure plates where the player
need to put weight on them so that it
activates the bridges where the player could
easily move to the other side of the land

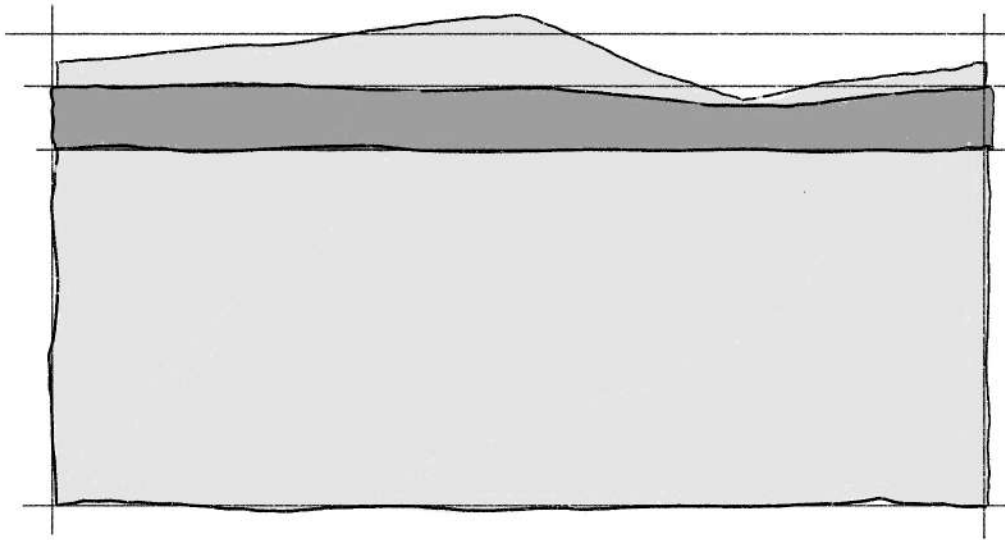

There is also a main pillar which could also be
used if the bridge is stuck just by rotation
them to the same facing direction

Basic layout of the brige where each
planks are made of stone which comes
out of nowhere from the deep ground
and the player can jump on otp of each
other and cross to the next land

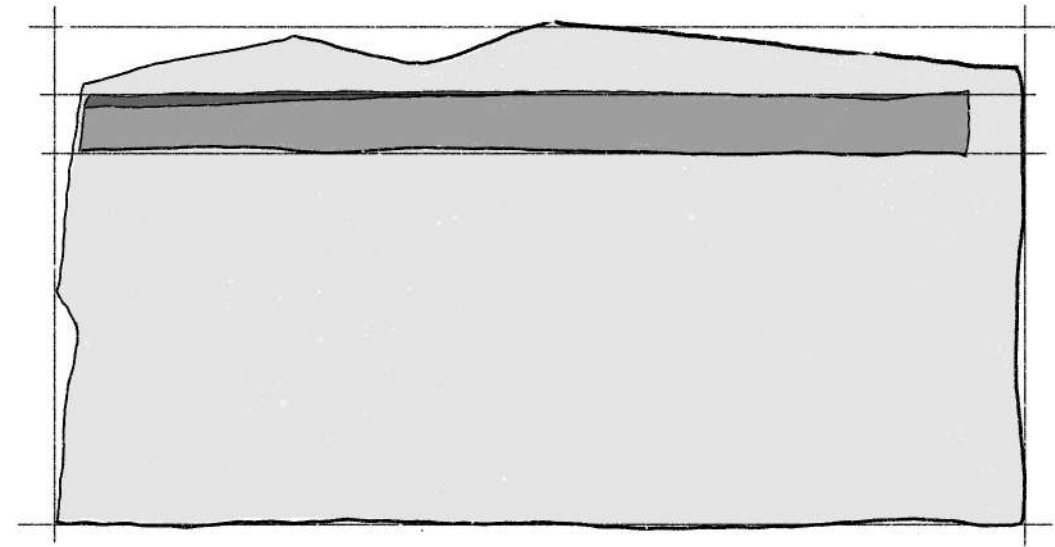

Detailed Drawing on Game Assets:

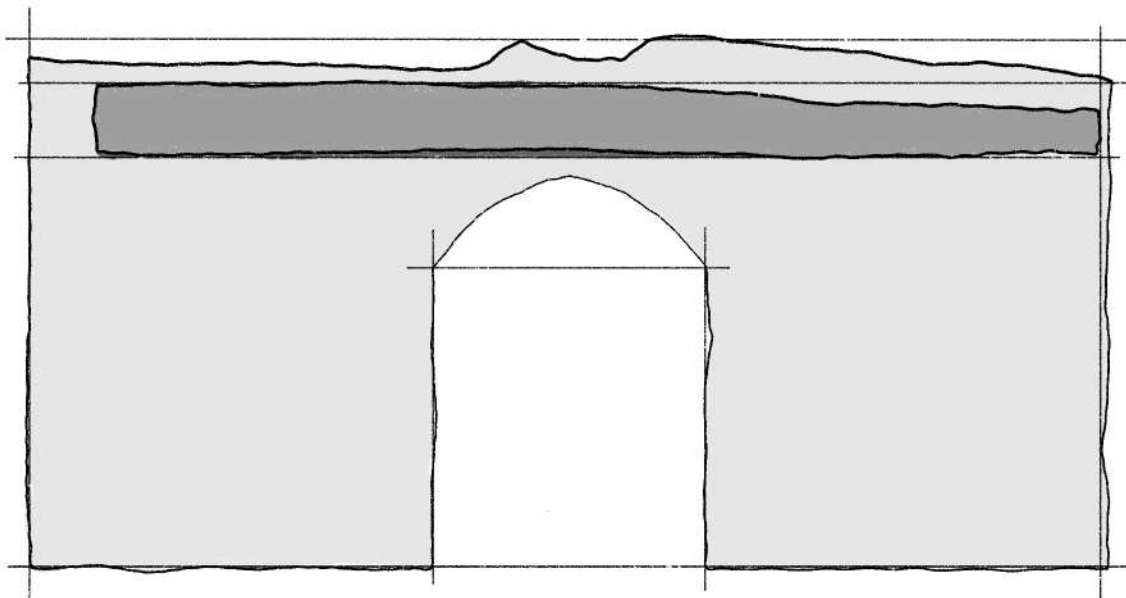

Wall 1 : Back wall next to the pillars

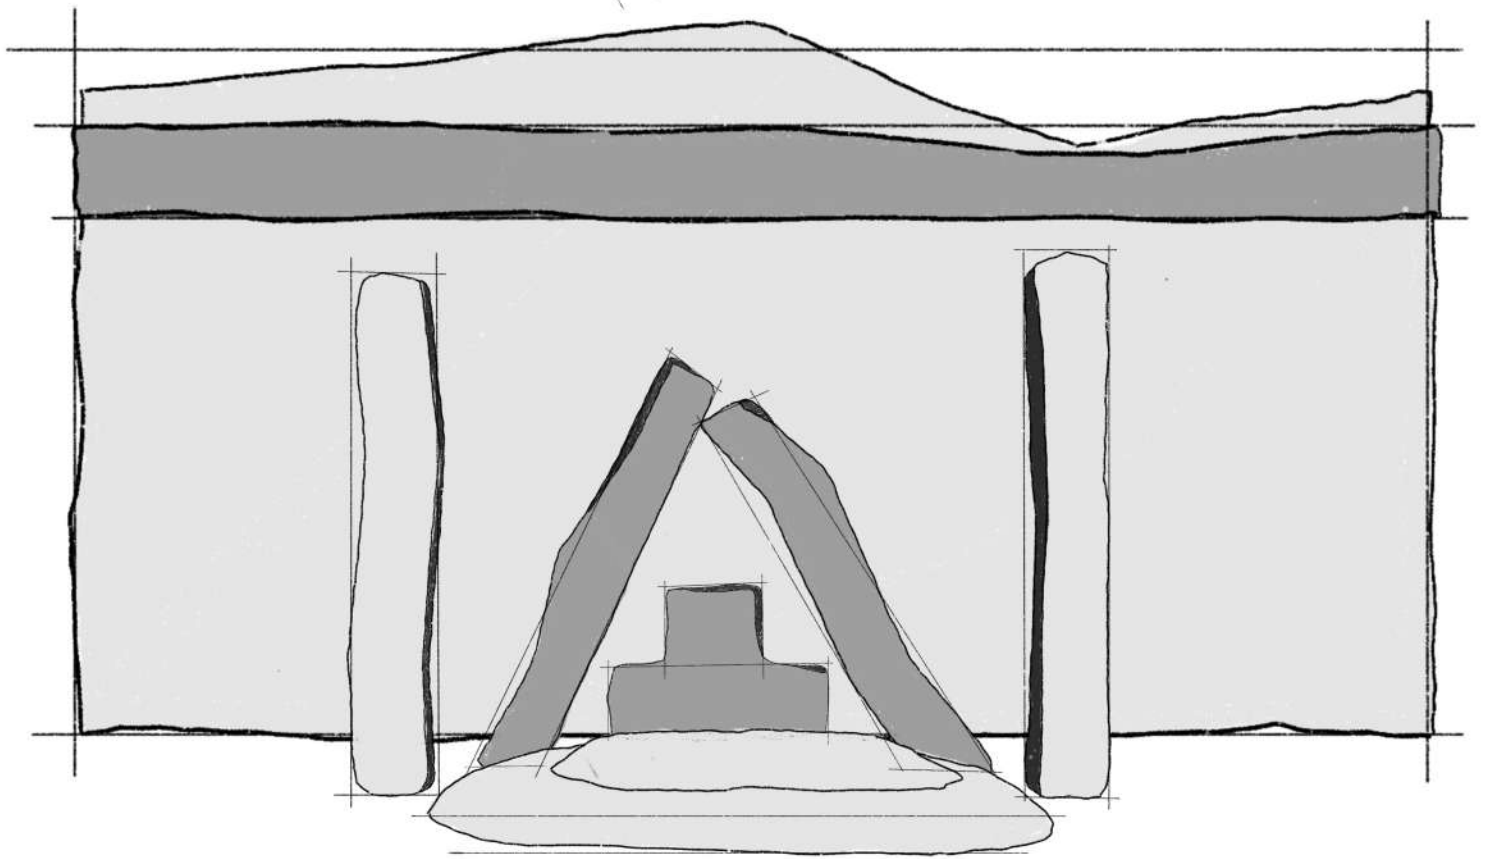

For the room where the warrior is been captured, I have created three different walls, small destruction on the top, side and edges of the wall

Wall 2 : Side wall

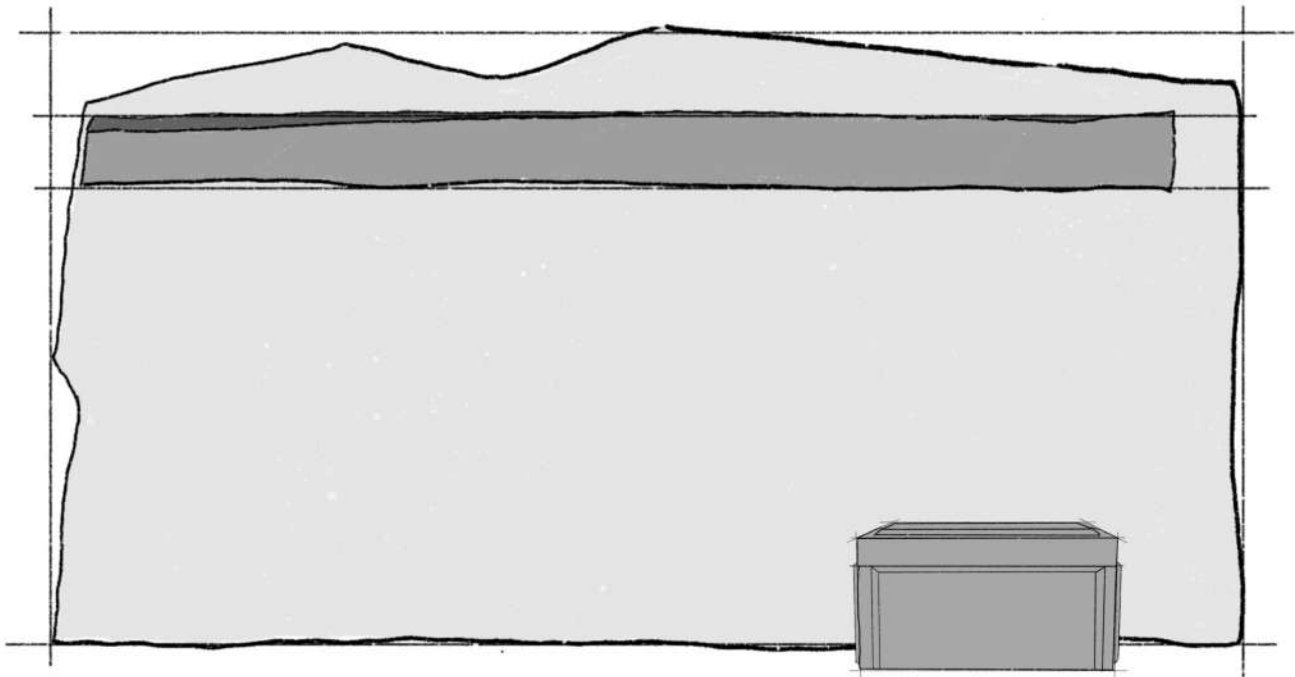

Wall 3 : The exit door wall

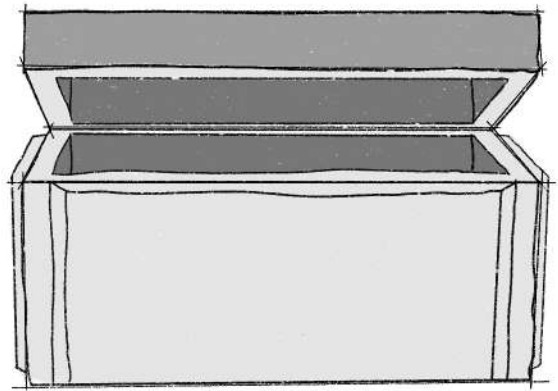

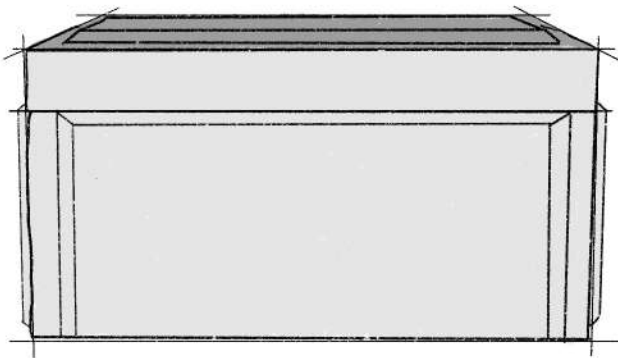

This is the initial idea how the pillars need to be placed with extra stone models

The warrior is trapped in the room where we could easily help him to break the chain just by pulling the pillars away so that they break and the warrior can eascape

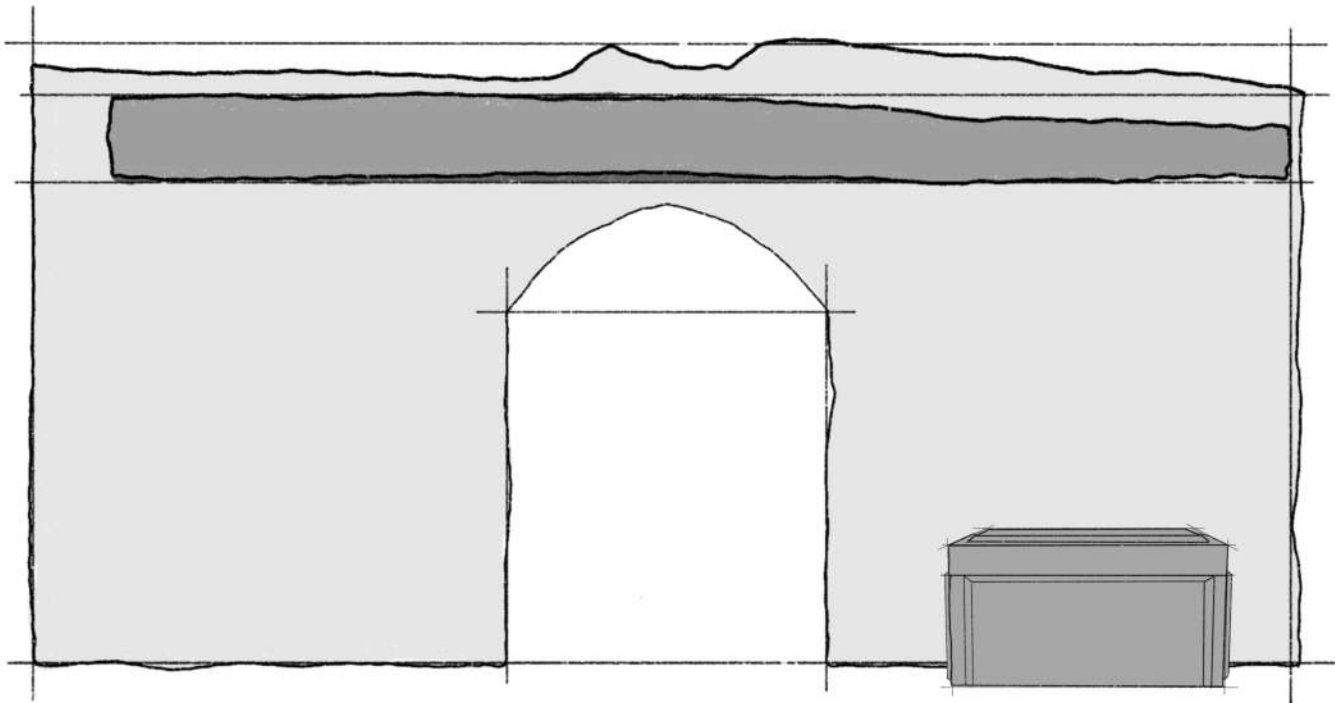

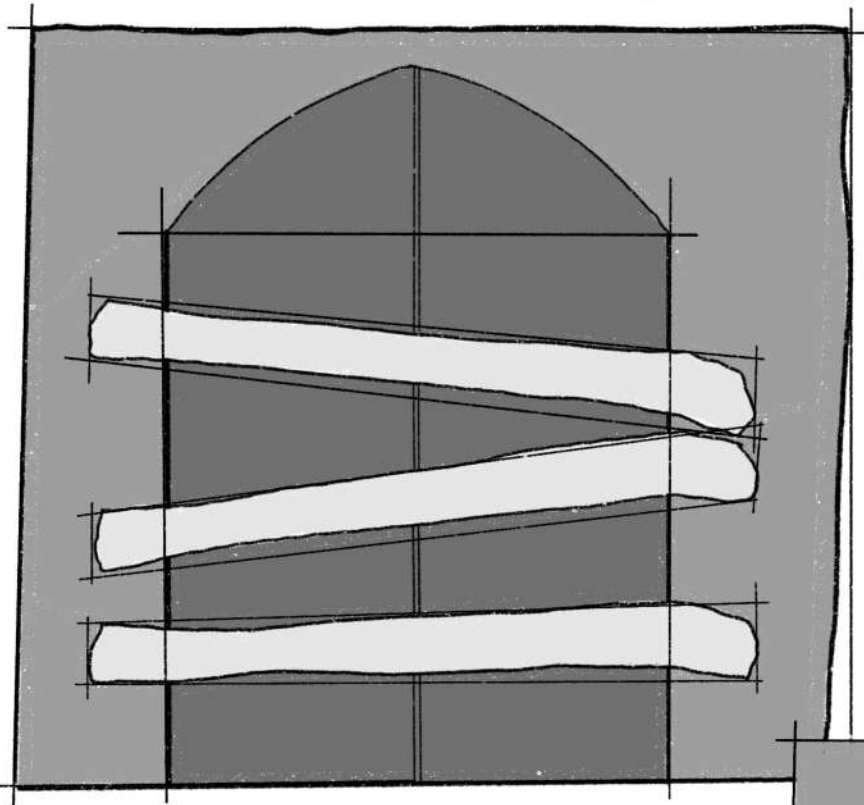

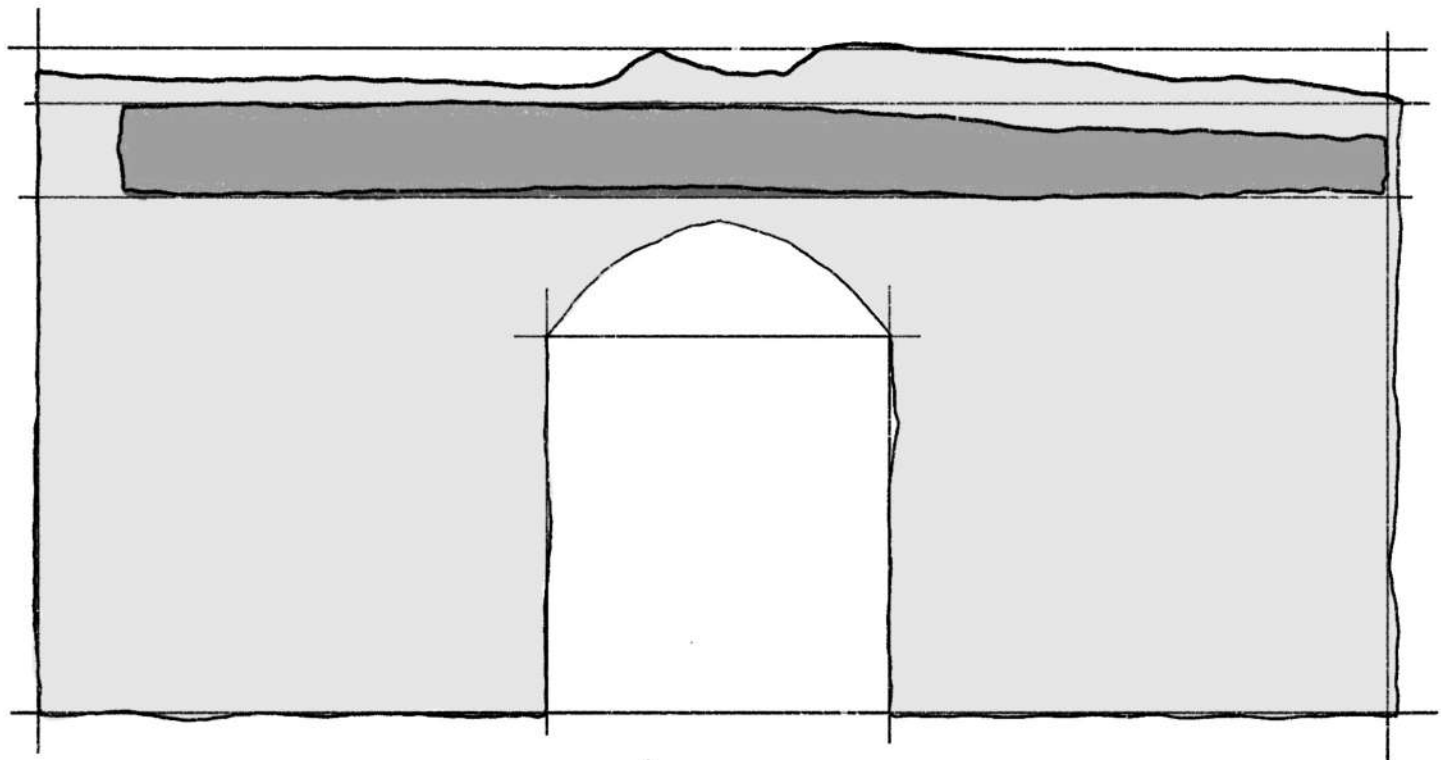

Side wall next to the pillars where the warrior is trapped has extra chest to discover

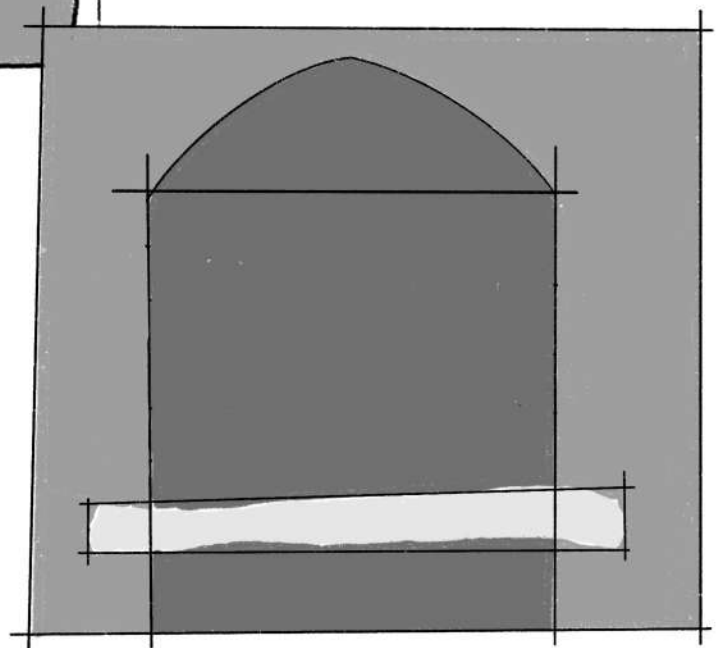

Close and Open chest where you can find some carrieables for the warrior

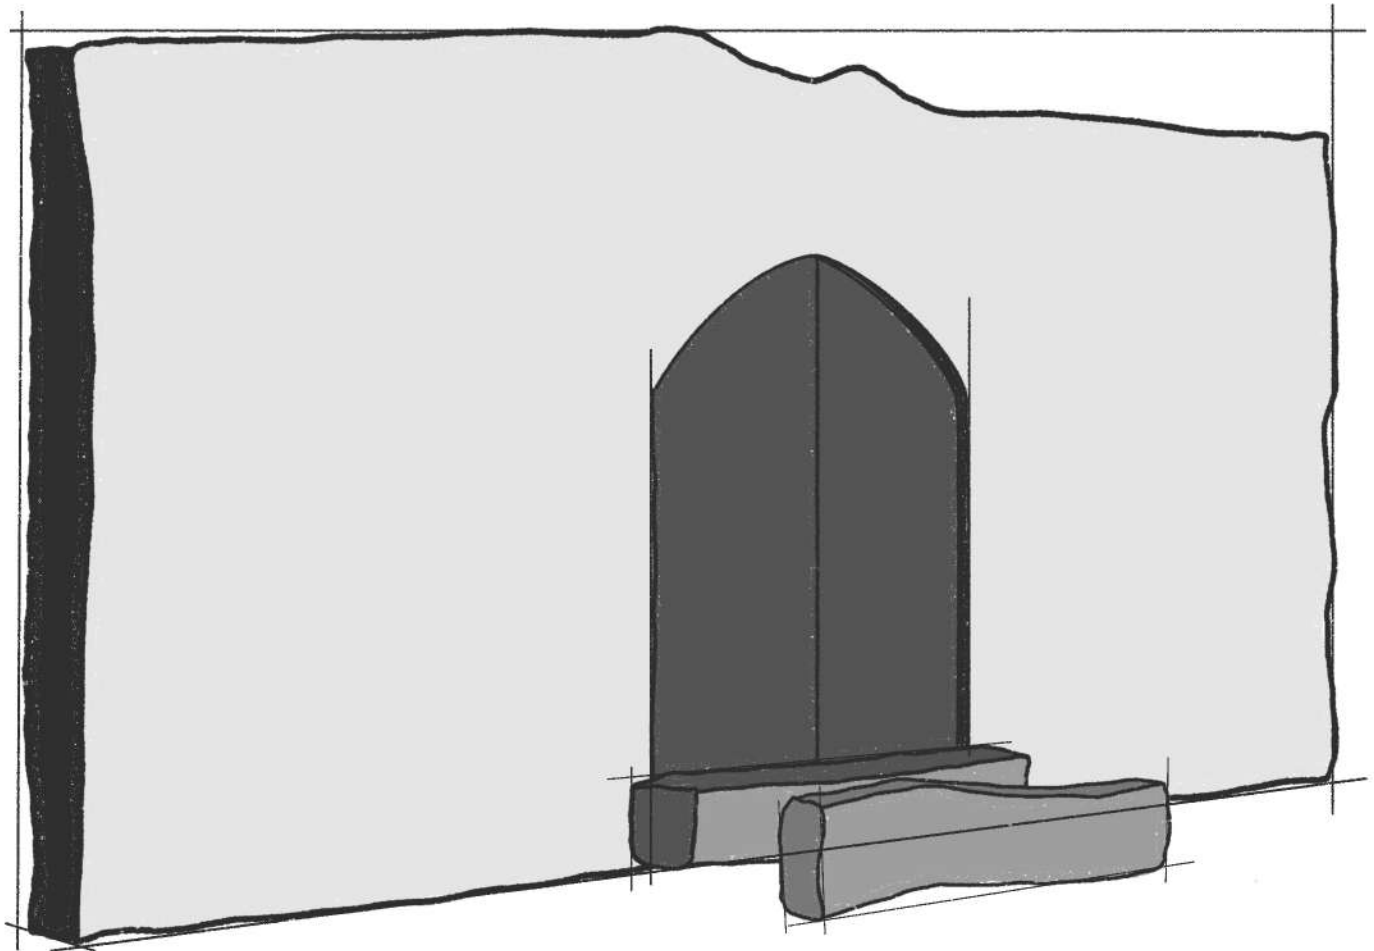

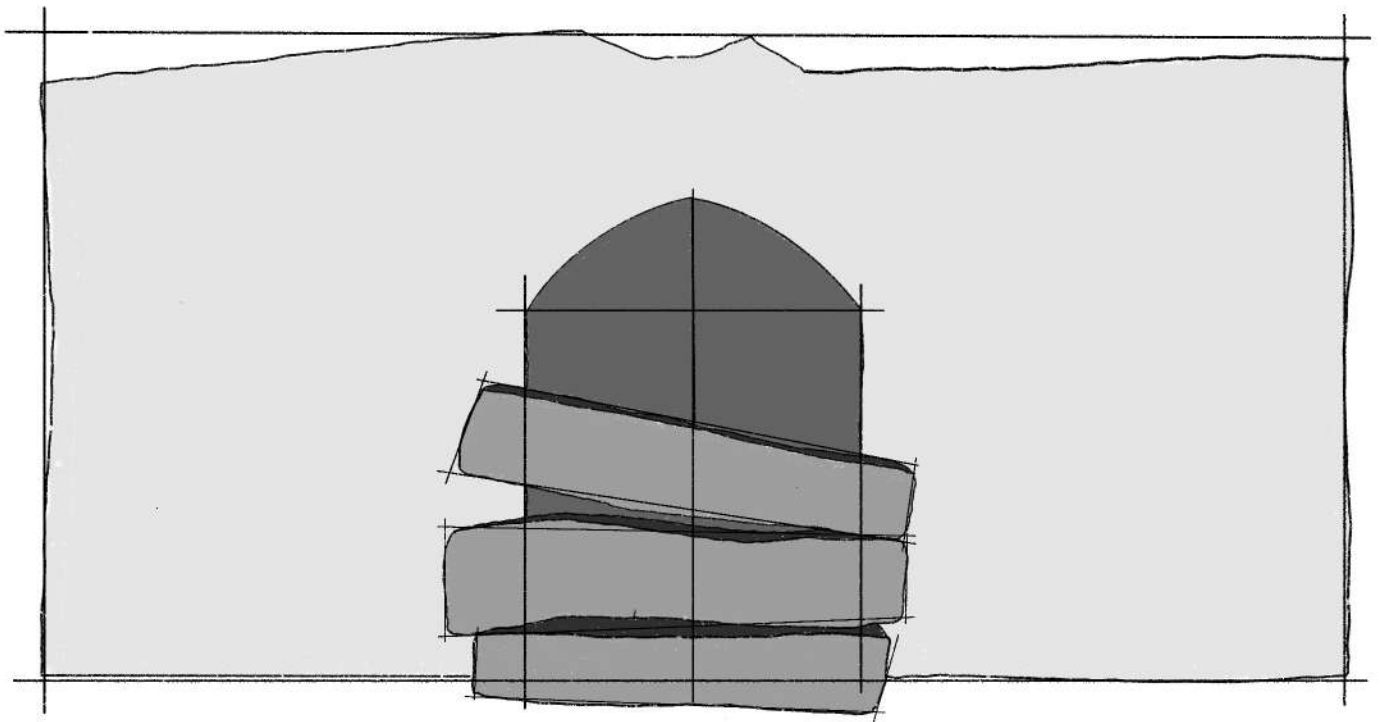

The same set of chest is placed next to the exit door where u can use to open them and find something useful fo the warrior to carry in his journey ahead likemaybe a sword and and a helmet or vest

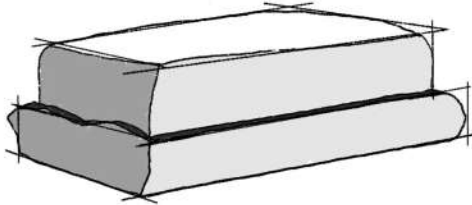

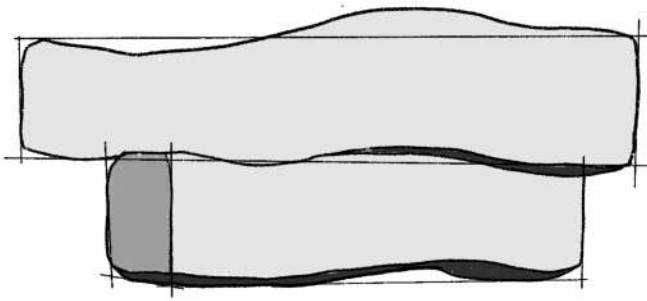

This is where the exit door is placed, but blocked with multiple heavy wooden planks where the warrior find it difficult to open, maybe he opens the one close to him but rest of the planks the player removes it for him

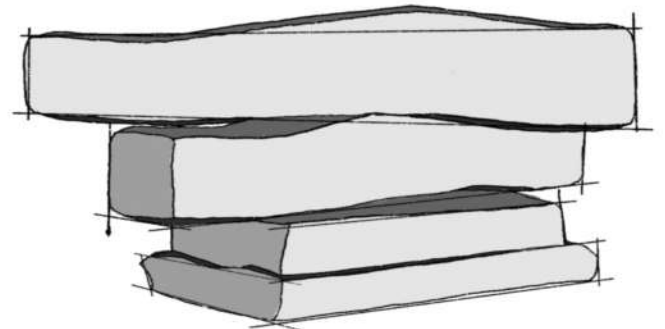

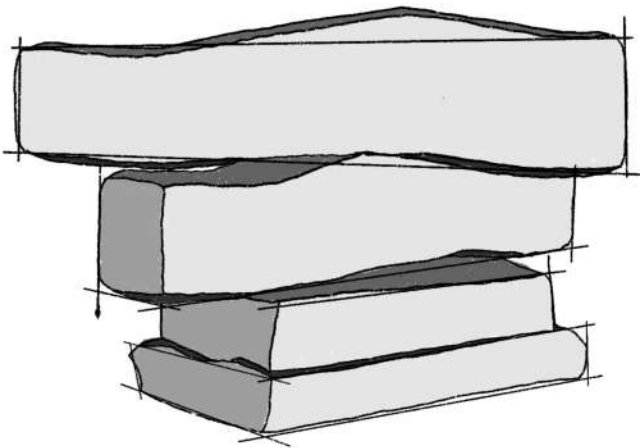

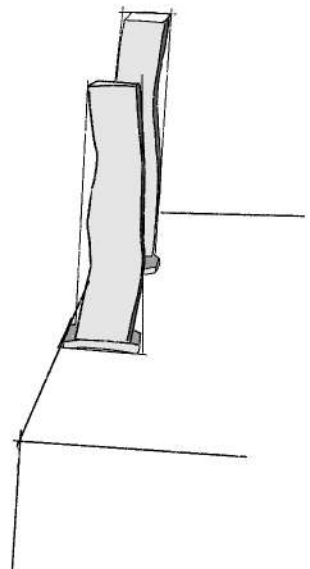

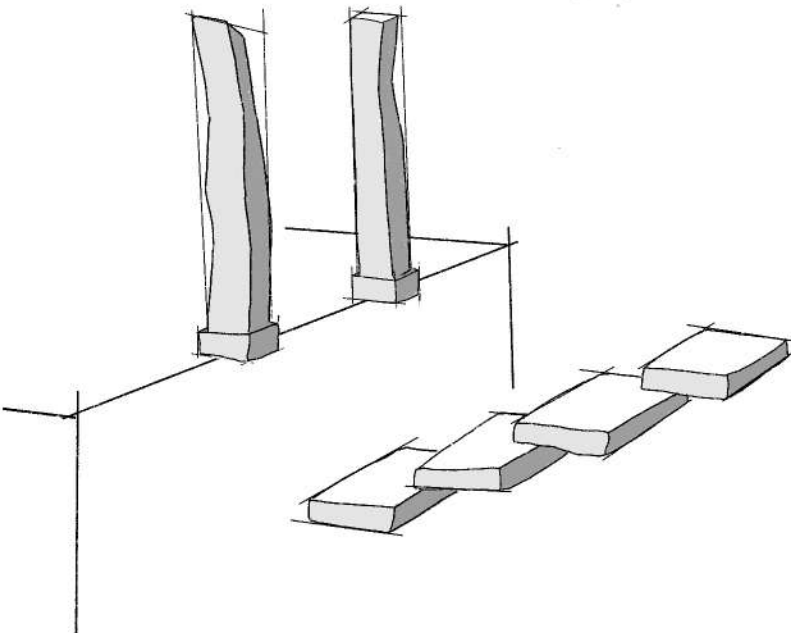

When the warrior moves out of the room the faces
next challenge where the door is closed from the
other side using heavy pillars. So no the player can
pick they one by one and move them away to open the
door for the warrior

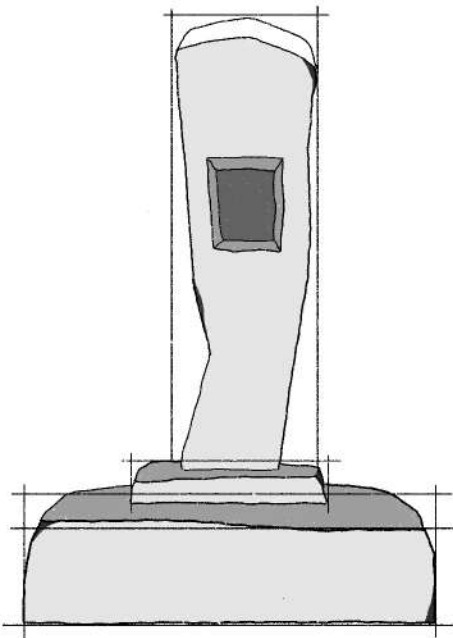

Now comes the next challenge where the warrior see the broken bridge with no path on them . Now the player has to observe the pressure plates and put the same pillars that was removed form the main door and now the bridge activates where some stone planks pop up one by one.

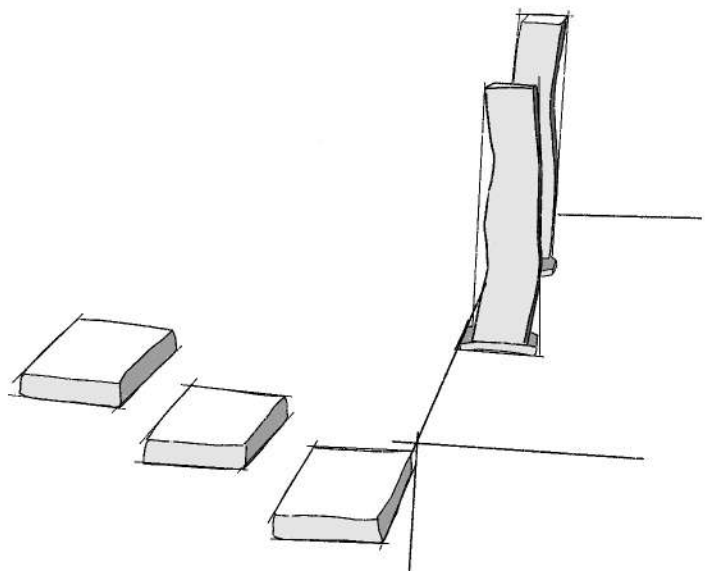

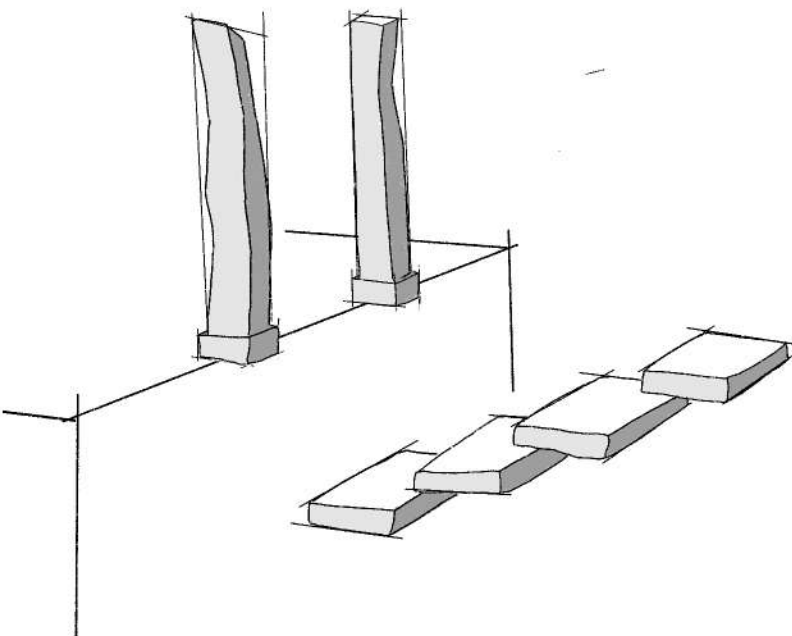

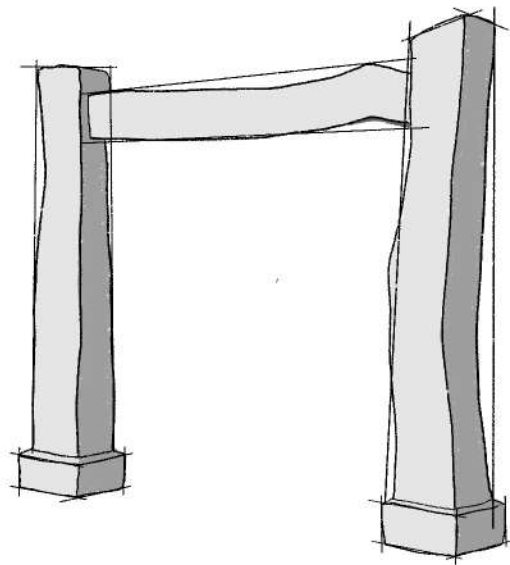

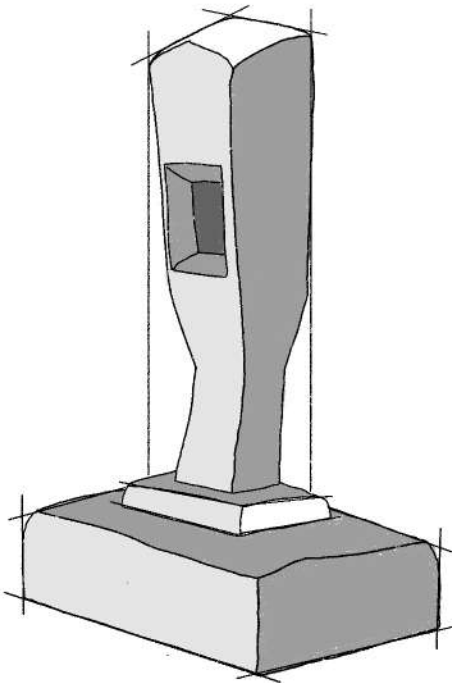

Only a very few stone planks appear wher e it confuses the player and the tiny warrior

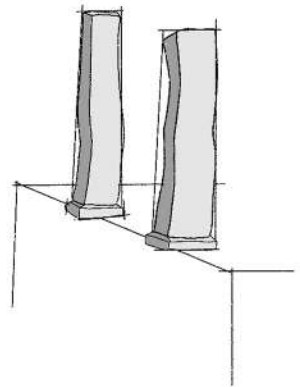

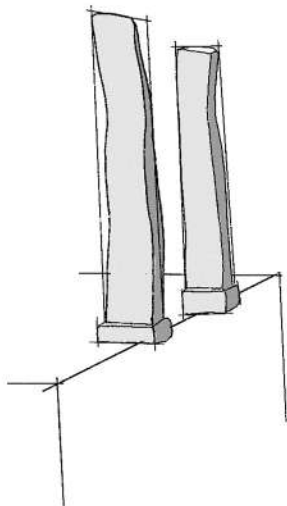

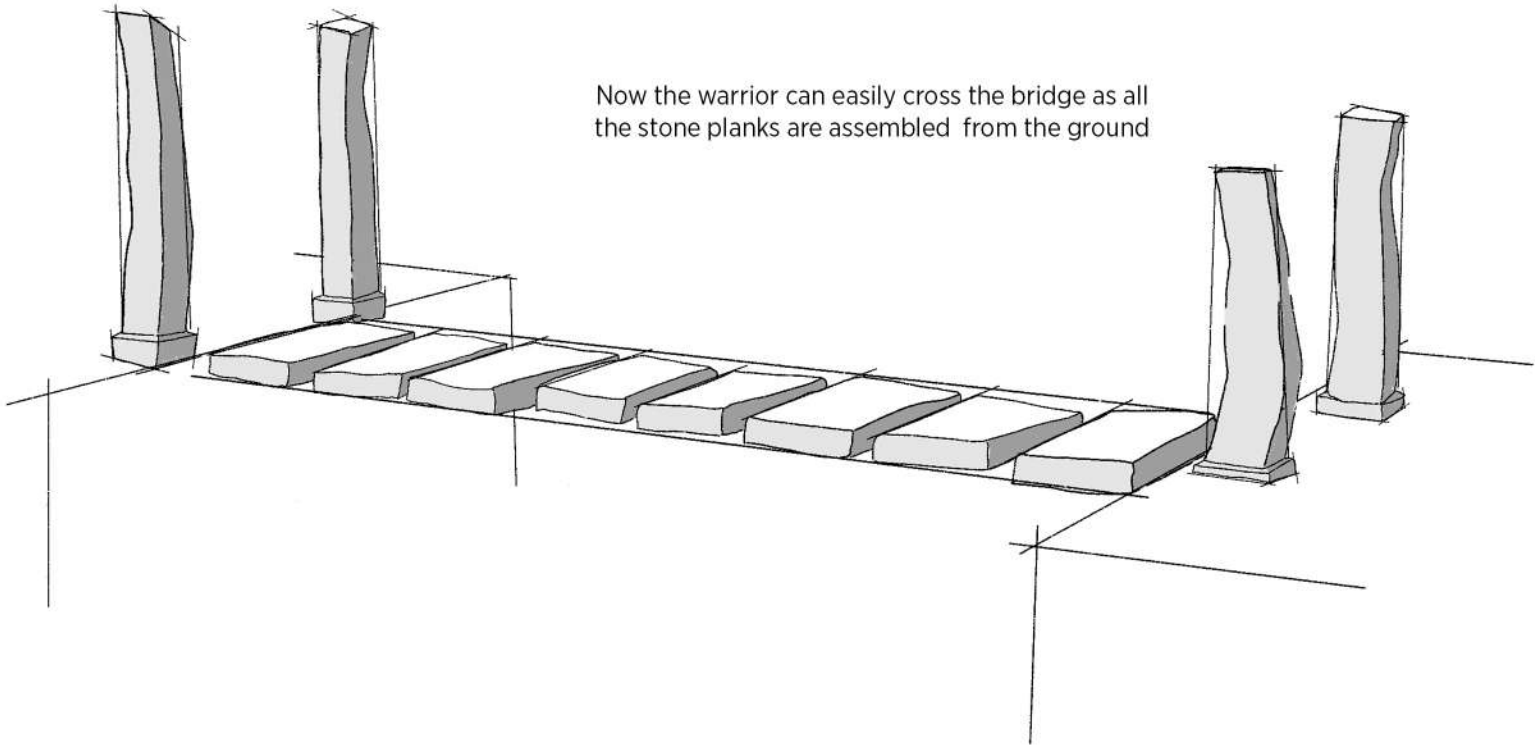

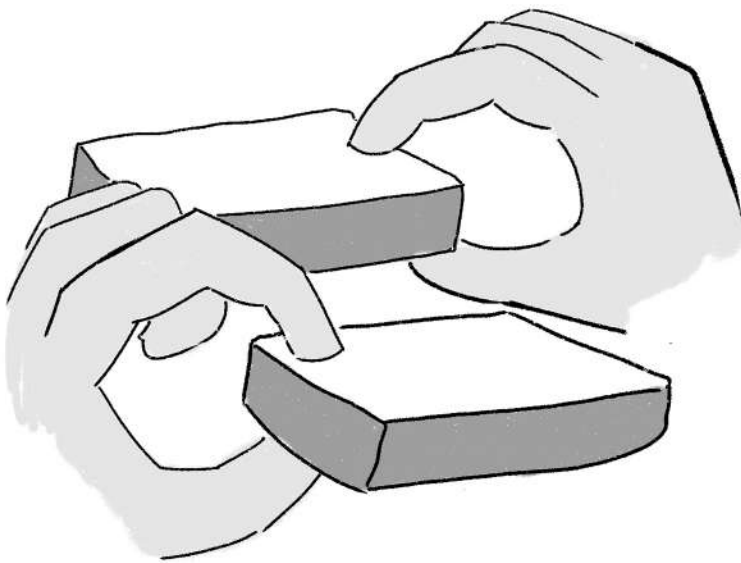

Here is the part where you use the stone pillar with a special marking on them to rotate its head and face each other on the other pillar across the bridge, which helps to bring up more stone planks

Now the warrior can easily cross the bridge as all the stone planks are assembled from the ground

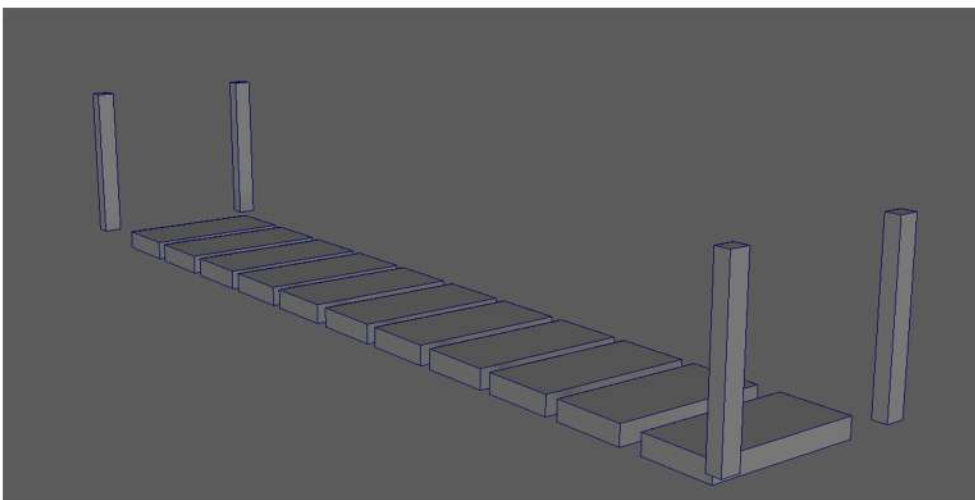

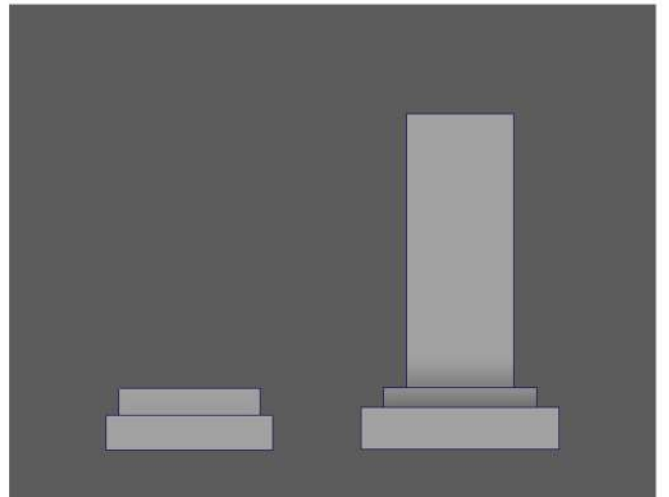

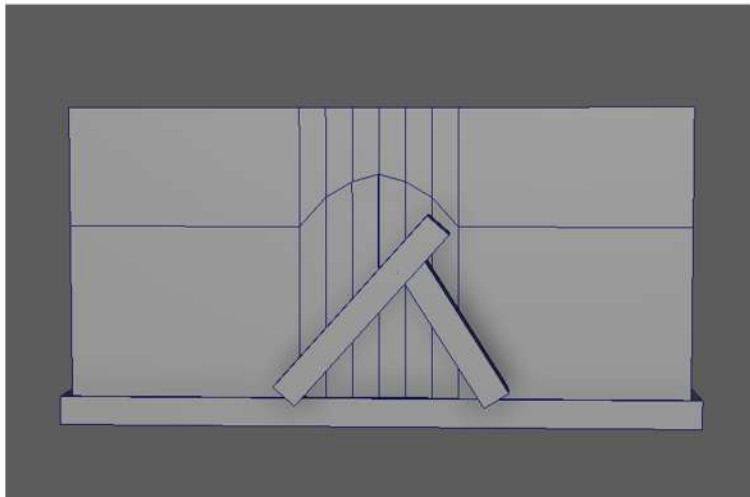

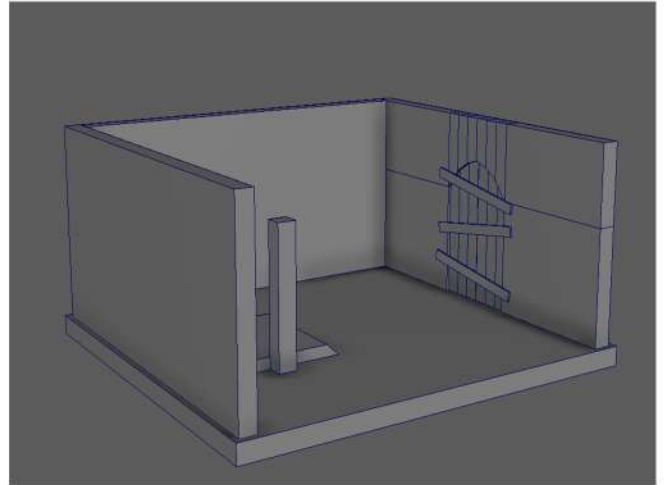

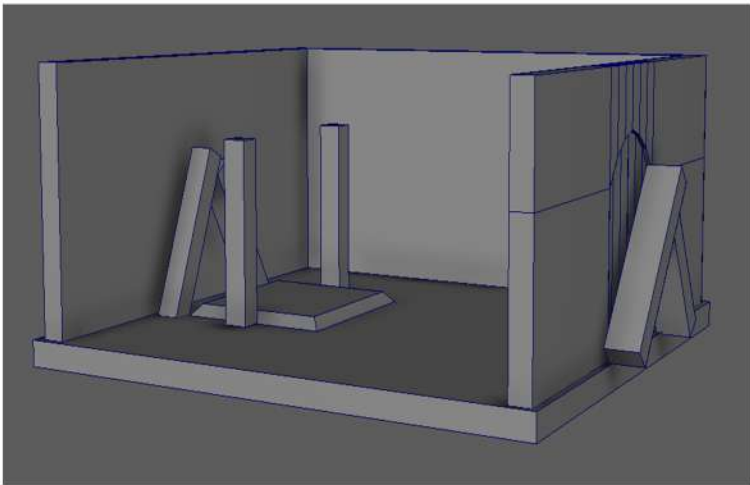

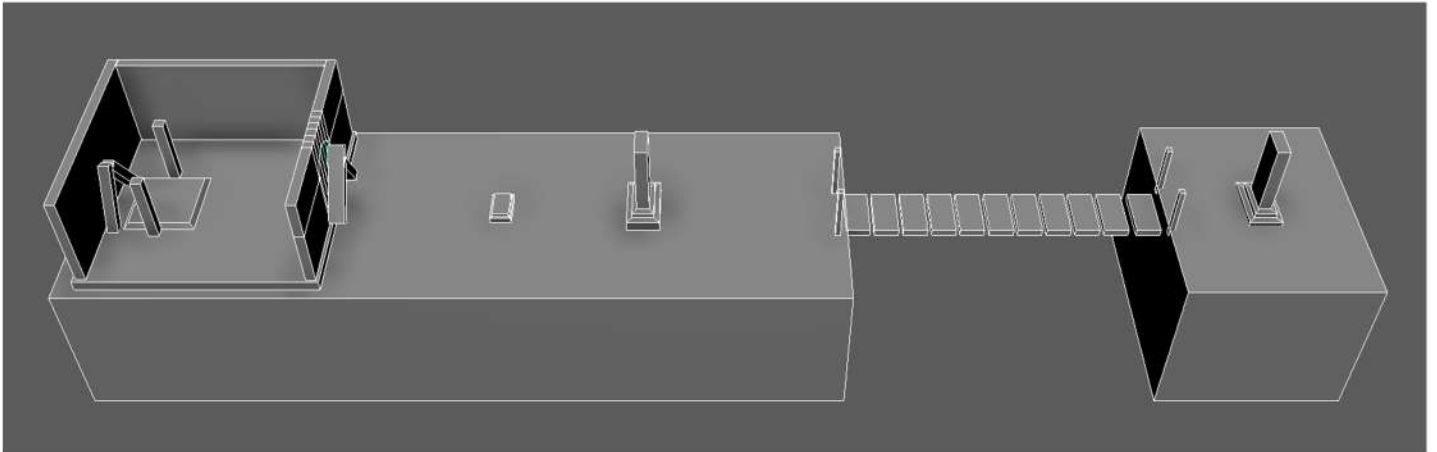

But here is the part where I should add more adventure where what if the warrior crossing the bridge slowly where each plank from the both side began to fall to the ground one by one

That's where you could hold the last two stone planks next to him and slowly place after another in front of the warrior so that he can easily walk on them and cross the bridge with the remaining planks

Blocking Stage:

With the help of Maya software, build the basic layout of the room, assets and land just like from the sketching done earlier.

Lowpoly Modeling:

Using the same shapes I tweak with some more details to maintain the same dimension. Additional edges are added to make more details on cracks and bends on the wall.
